hly similar to the gene products of S. cerevisiae cdc 28 and S. pombe cdc2. It is a catalytic subunit of t he protein kinase complex that is important for cell cycle G1 phase progression. The activity of this kina se is restricted to the G1-S phase, which is controll ed by the regulatory subunits D-type cyclins and C DK inhibitor p16(INK4a). This kinase was shown to be responsible for the phosphorylation of retinoblas toma gene product (Rb). Mutations in this gene as well as in its related proteins including D-type cycli
